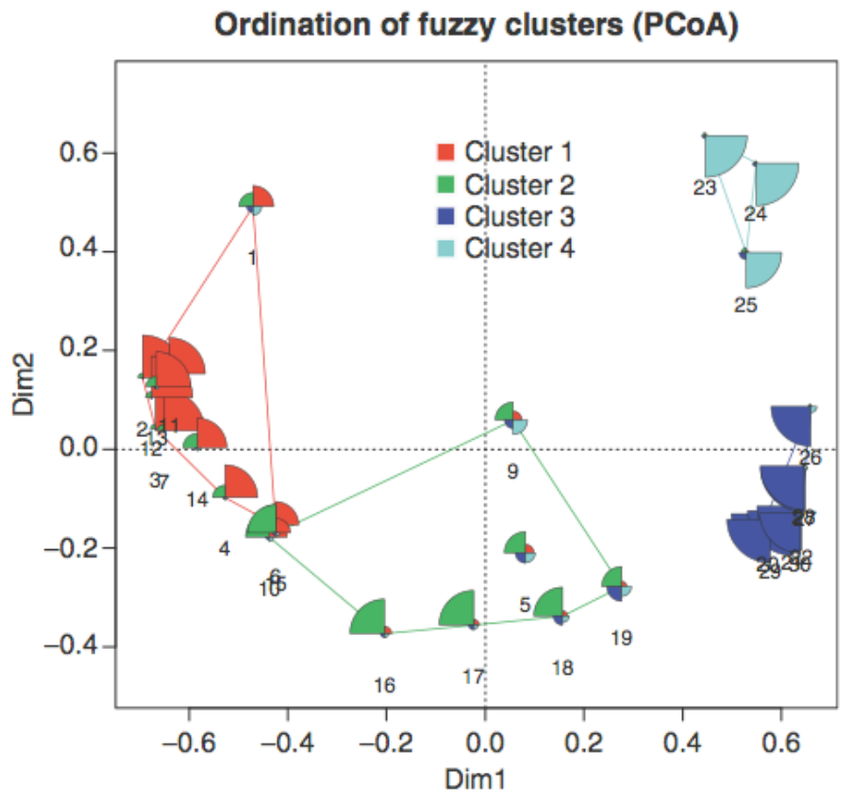
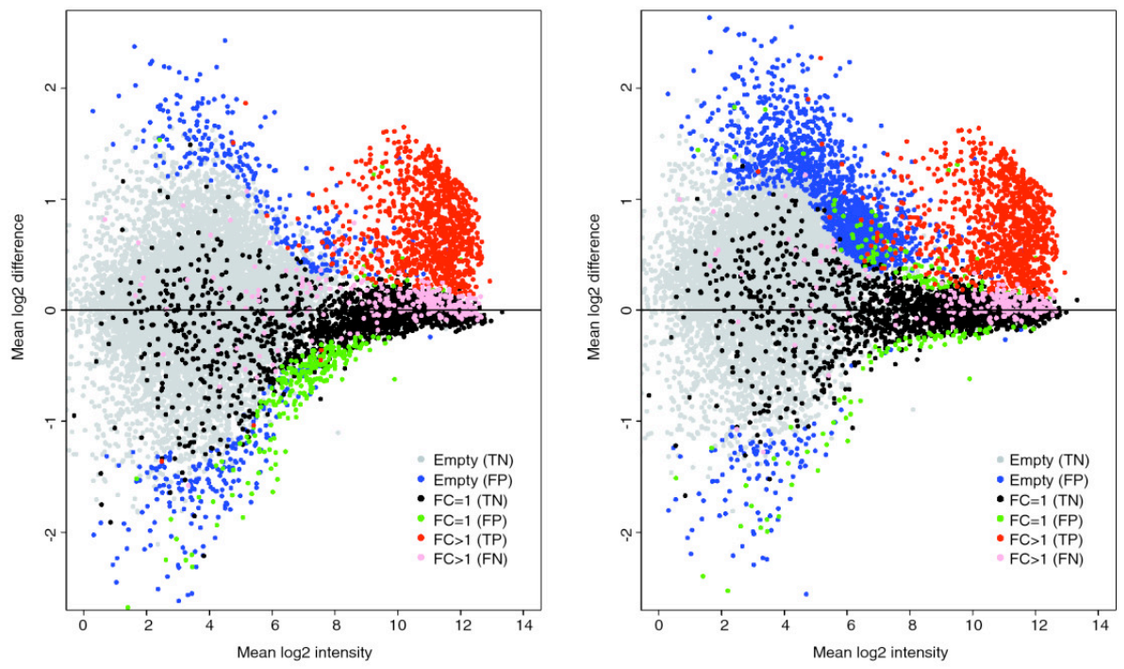
An Introduction to R

Scott A. Handley, PhD
Washington University St Louis

What is R?

A free software environment for statistical computing and graphics





Why is R useful?

- Data management and manipulation
- Well established system of packages and documentation
- Support for rich statistical simulation and modeling
- Active development and dedicated community
- Cutting-edge graphical data visualization
- Free!

Where to learn more about R

- The R Project Homepage: http://www.r-project.org
- Quick R Homepage: http://www.statmethods.net
- Bioconductor: http://www.bioconductor.org
- An Introduction to R (long!): http://cran.r-project.org/doc/manuals/R-intro.html
- Google - there are tons of tutorials, guides, demos, packages and more

R for Biologists

- Bioconductor (http://bioconductor.org)
    - 2,140 packages (21-August, 2022):
        - Variant detection: coding changes, PolyPhen database
        - Annotation: pathway analysis, access GO, KEGG, NCBI and many others
        - High-throughput assays: flow cytometry, mass spec
        - Transcription factor binding detection
- Ecology (see: http://cran.r-project.org/web/views/Environmetrics.html)
        - Ordination
        - Cluster Analysis
        - Ecological Theory
        - Population Dynamics
        - Spatial Data Analysis
- Phylogenetics and Evolution (see: http://cran.r-project.org/web/views/Phylogenetics.html)
    - Ancestral State Reconstruction
    - Phylogenetic Inference
    - Trait Evolution

Obtaining R

- Windows, Mac or Linux OS: https://www.r-project.org

Running R

- Install a R Integrated Development Environment (IDE)
    - RStudio: http://www.rstudio.com
    - Makes working with R much easier, particularly for a new R user
    - Run on Windows, Mac or Linux OS
- Or from the command line, type R

R Studio

```

Help

- Do you need to remember all of the variables?
- ? is your friend
- ?plot

plot {graphics}

Generic X-Y Plotting

Description

Generic function for plotting of R objects. For more details about the graphical parameter arguments, see par.

For simple scatter plots, plot.default will be used. However, there are plot methods for many R objects, includi
functions, data.frames, density objects, etc. Use methods(plot) and the documentation for these.

Usage

```
plot(x, y, ...)
```

R Documentation

`type`

what type of plot should be drawn. Possible types are

- "p" for **p**oints,
- "l" for **l**ines,
- "b" for **b**oth,
- "c" for the lines part alone of "b",
- "o" for both '**o**verplotted',
- "h" for '**h**istogram' like (or 'high-density') vertical lines,
- "s" for stair **s**teps,
- "S" for other **s**teps, see 'Details' below,
- "n" for no plotting.

Data Frames

- A data.frame is essentially a table
- columns can be mixed types
  - numeric, text strings
- rows must be same type

	clostridia	proteobacteria	bacteroides
01_healthy	22	54	245
02_healthy	26	65	265
03_healthy	34	66	262
01_sick	32	32	116
02_sick	12	24	101
03_sick	9	18	87

```
data.frame[-1,-2]
```

row

column

	clostridia	bacteroides
02_healthy	26	265
03_healthy	34	262
01_sick	32	116
02_sick	12	101
03_sick	9	87

Data Frame Manipulations

	clostridia	proteobacteria	bacteroides
01_healthy	22	54	245
02_healthy	26	65	265
03_healthy	34	66	262
01_sick	32	32	116
02_sick	12	24	101
03_sick	9	18	87

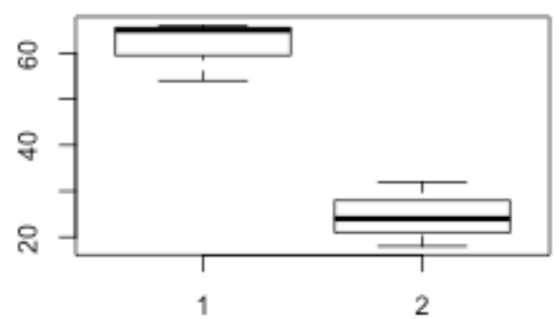
```
data.frame$proteobacteria
```

[1] 54 65 66 32 24 18

```
t.test(data.frame$proteobacteria[1:3],
data.frame$proteobacteria[4:6])
```

p-value = 0.002725

```
boxplot(data.frame$proteobacteria[1:3],
data.frame$proteobacteria[4:6])
```



Getting Help in R

?write.table

Description

`write.table` prints its required argument `x` (after converting it to a data frame if it is not one nor a matrix) to a file or connection.

Usage

```
write.table(x, file = "", append = FALSE, quote = TRUE, sep = " ",
            eol = "\n", na = "NA", dec = ".", row.names = TRUE,
            col.names = TRUE, qmethod = c("escape", "double"),
            fileEncoding = "")

write.csv(...)
write.csv2(...)
```

Arguments

`x`	the object to be written, preferably a matrix or data frame. If not, it is attempted to coerce `x` to a data frame.
`file`	either a character string naming a file or a connection open for writing. `""` indicates output to the console.
`append`	logical. Only relevant if `file` is a character string. If `TRUE`, the output is appended to the file. If `FALSE`, any existing file of the name is destroyed.

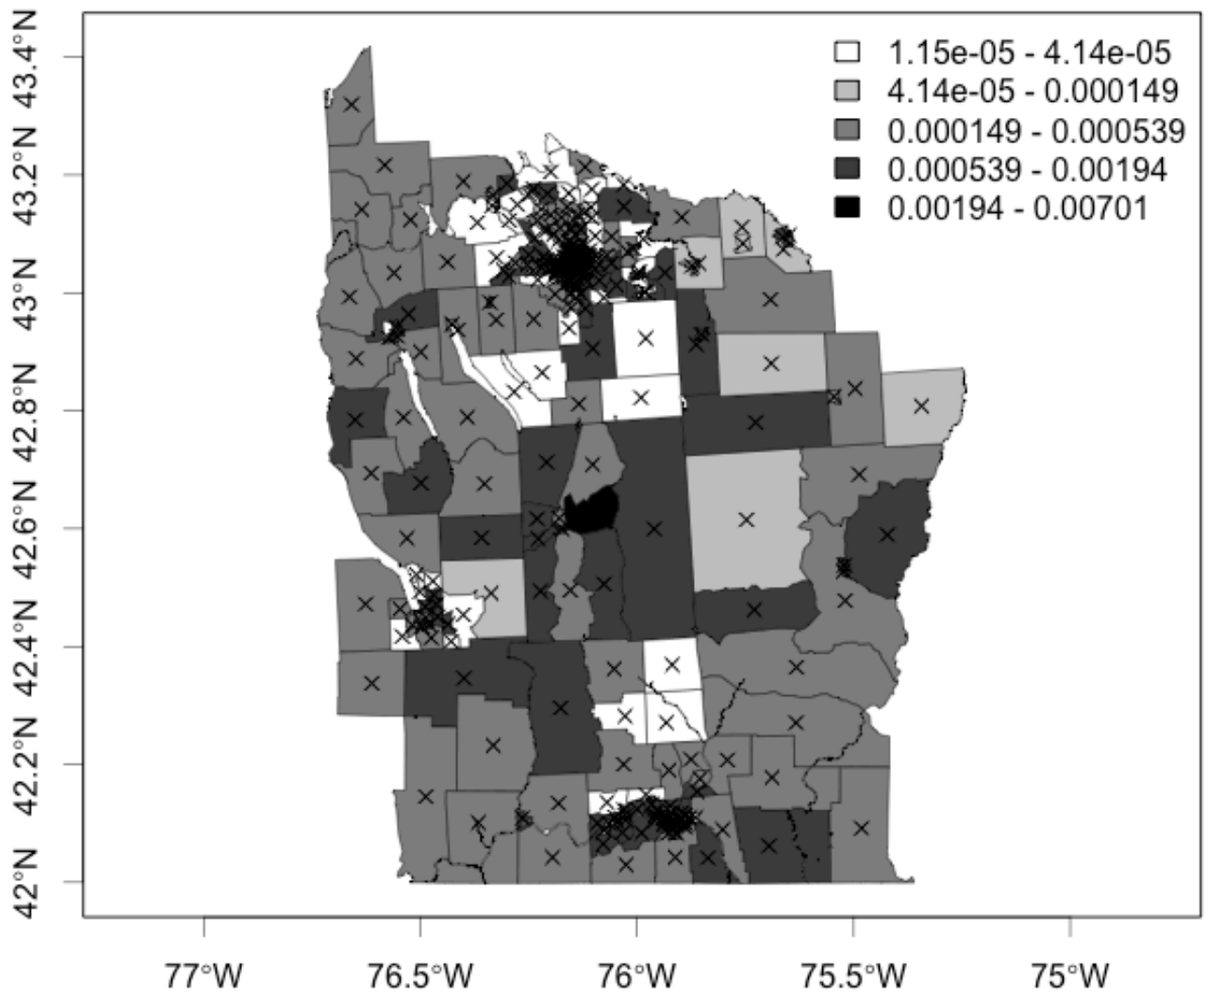
Advanced and Other Applications in R

Spatial Epidemiology and Maps

```
library(SpatialEpi)

data(NYleukemia)
sp.obj <- NYleukemia$spatial.polygon
centroids <- latlong2grid(NYleukemia$geo[, 2:3])
population <- NYleukemia$data$population
cases <- NYleukemia$data$cases

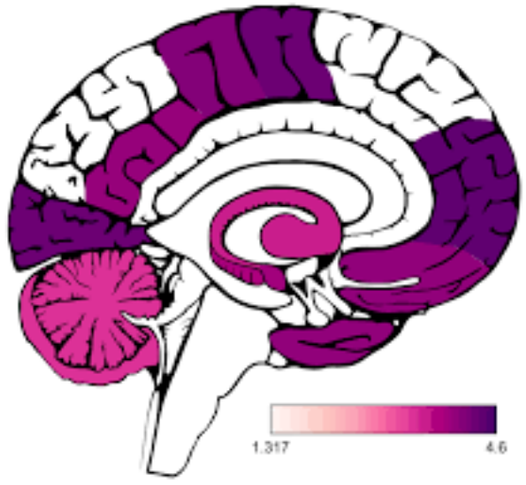
plotmap(cases/population, sp.obj, log=TRUE, nclr=5)
points(grid2latlong(centroids), pch=4)
```



Anatomical Mapping

CerebroViz

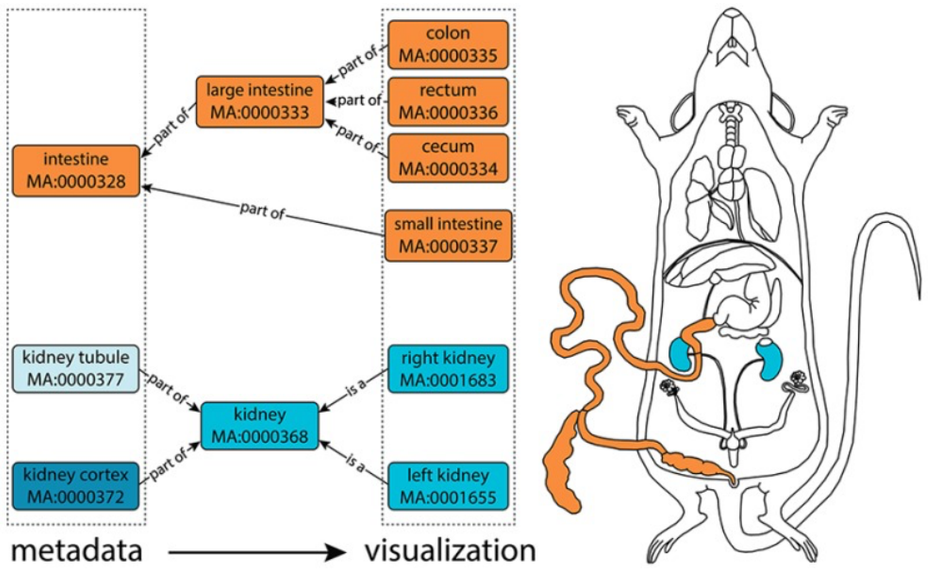
https://github.com/ethanbahl/cerebroViz



```
library("cerebroViz")
data(cerebroEx)
head(cerebroEx)[, c(1:7)]
```

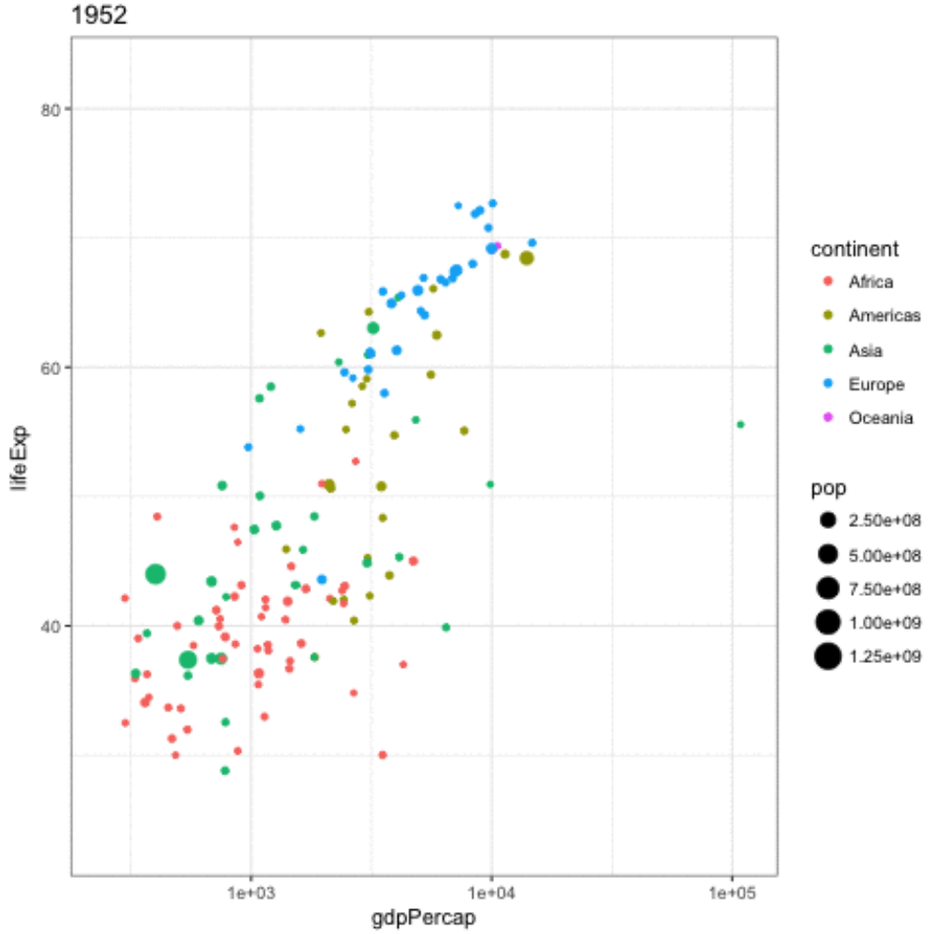
COMICS

https://github.com/y-popov/COMICS



Animation / Interactivity

Indicator Name	2011	2012	2013	2014	2015	2016	Average	Improvement
Prevalence of Obesity	19.1	23.6	23.3	20.5	24.0	23.2	22.28	-21.47
Prevalence of Tobacco Use	17.4	15.0	15.3	12.2	16.6	16.7	15.53	4.02
Prevalence of Cardiovascular Disease	5.0	4.9	1.5	4.4	4.9	6.2	4.48	-24.00
Prevalence of Diabetes	8.0	7.2	9.3	7.2	7.5	10.4	8.27	-30.00



Tidyverse

What is the tidyverse

The tidyverse is an opinionated collection of R packages designed for data science. All packages share an underlying design philosophy, grammar, and data structures.

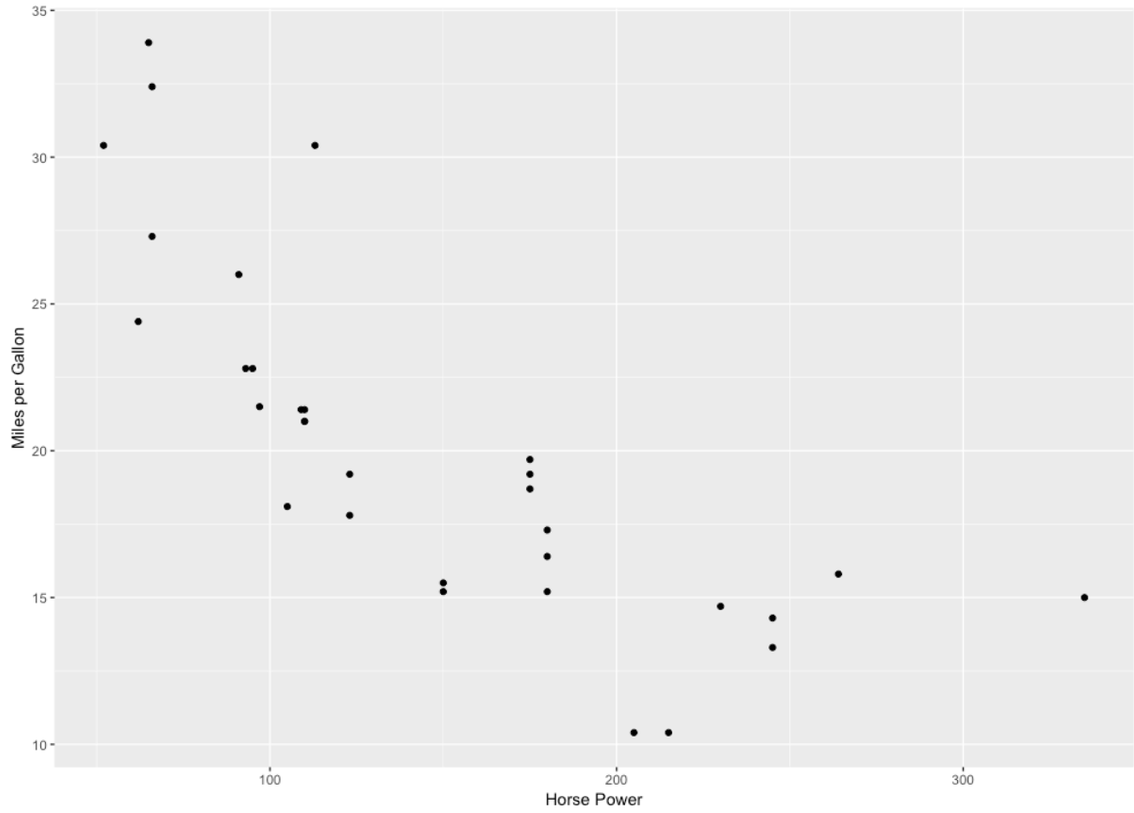
- ggplot2: a system for creating graphics (**G**rammar of **G**raphics)
- dplyr: a system for data manipulation
- tidyr: functions for tidying data
- readr: a system for reading in data
- purrr: functional programming in R
- string: system for working with strings
- forcats: system for working with factors (categorical

ggplot

Step 1: Initiate your data and aesthetics
ggplot(mtcars, aes(x=hp, y=mpg))

Step 2: Apply geometry
geom_point()

Step 3: Refine
labs(y="Miles per Gallon", x = "Horse Power")



```
ggplot(mtcars, aes(x=hp, y=mpg)) +
    geom_point() +
    labs(y="Miles per Gallon", x = "Horse Power")
```

dplyr

- **mutate()** adds new variables that are functions of existing variables
- **select()** picks variables based on their names
- **filter()** picks cases based on their values
- **summarise()** reduces multiple values down to a single summary
- **arrange()** changes the ordering of the rows

dplyr::mutate

```
> head(mtcars)
                   mpg cyl disp  hp drat    wt  qsec vs am gear carb
Mazda RX4         21.0   6  160 110 3.90 2.620 16.46  0  1    4    4
Mazda RX4 Wag     21.0   6  160 110 3.90 2.875 17.02  0  1    4    4
Datsun 710        22.8   4  108  93 3.85 2.320 18.61  1  1    4    1

```
## R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for
authoring HTML, PDF, and MS Word documents. For more details on using R
Markdown see <http://rmarkdown.rstudio.com>.

When you click the **Knit** button a document will be generated that includes
both content as well as the output of any embedded R code chunks within the
document. You can embed an R code chunk like this:
```

CHUNK

```
```{r title}
contents
```
```

```
```{r starwars}
head(starwars)

# Exploratory data analysis
ggplot(starwars, aes(x=mass, y=height, color = homeworld)) +
  geom_point()

```
```
